RESEARCH INTERESTS

My research interests lie primarily in the broad areas of *artificial intelligence* and (*algorithmic*) *data science*, with the main goal of tackling (novel) problems and designing effective yet efficient algorithms that are useful to gain knowledge from data. Due to the fact that much of today's data can be represented as graphs, my emphasis has primarily been on formalizing data-driven challenges as graph problems and developing scalable methods to analyze complex relational structures. More specifically, my recent research interests include *graph mining and learning*, *explainable AI*, and *natural language processing*—the latter mainly in settings where graphs come with rich textual descriptions (e.g., node/edge metadata or associated documents) that can be leveraged to enhance graph representations and reasoning.
